

SOC/SIEM INCIDENT REPORT

Local Account Creation and Local Administrators Group Modification

Prepared by	Christopher Iskaros
Report date	May 14, 2026
Environment	Hyper-V homelab with Wazuh SIEM and Windows endpoint
Incident type	Controlled simulation / detection validation
Status	Contained and remediated

Executive Summary

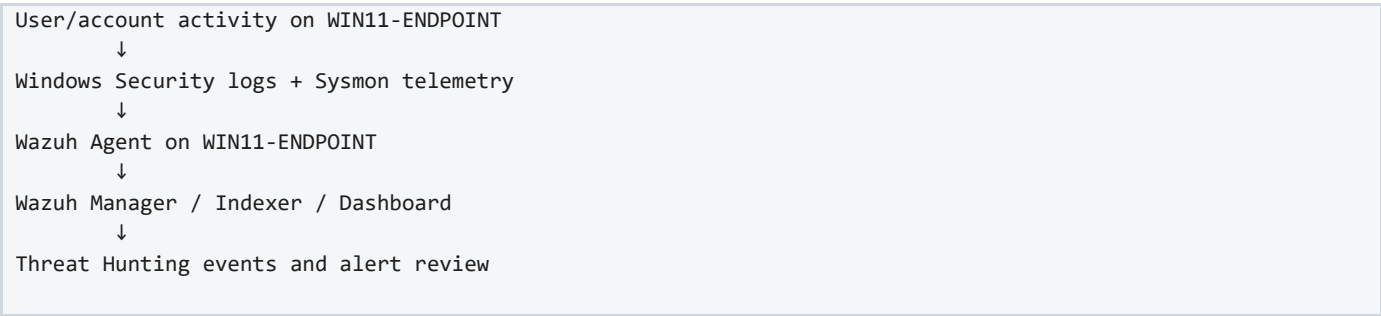

- A local user account named labtest was created on WIN11-ENDPOINT and added to the local Administrators group.
- Windows Security logs captured Event ID 4720 for user creation and Event ID 4732 for local group membership modification.
- Wazuh generated alert events for the user account creation and Administrators group change.
- The test account was removed from the Administrators group, deleted, and cleanup was verified.

1. Environment and Scope

Component	Details
Host platform	Microsoft Hyper-V
SIEM platform	Wazuh
SIEM server	Ubuntu Server VM / Wazuh-SIEM
Wazuh manager IP	192.168.56.10
Endpoint	WIN11-ENDPOINT
Endpoint IP	192.168.56.20
Endpoint OS	Windows 11 Enterprise Evaluation
Log sources	Windows Security logs, Sysmon telemetry, Wazuh Agent
Network design	Isolated internal SOC lab network using static IP addressing

2. Detection Pipeline

The scenario validated that endpoint activity could be observed locally and centrally through the SIEM workflow below:

3. Key Findings

Finding	Evidence
Local user account created	Windows Event ID 4720; Wazuh rule: User account enabled or created
User added to local Administrators group	Windows Event ID 4732; Wazuh rule: Administrators Group Changed
Endpoint identity confirmed	WIN11-ENDPOINT / 192.168.56.20 in Wazuh event details
Cleanup completed	labtest removed from Administrators, account deleted, net user verification returned not found

4. Observed Activity

The following activity was performed from Administrator PowerShell on WIN11-ENDPOINT as a controlled lab simulation. The password used during testing is intentionally redacted in the evidence screenshots.

```
net user labtest [REDACTED] /add
net localgroup administrators labtest /add
net user labtest
net localgroup administrators
```

5. Event and Alert Summary

Source	Event / Rule	Meaning	Result
Windows Security	Event ID 4720	A user account was created	labtest account creation confirmed
Windows Security	Event ID 4732	A member was added to a security-enabled local group	labtest added to Builtin\Administrators
Wazuh	Rule 60109 / Level 8	User account enabled or created	Alert observed for WIN11-ENDPOINT
Wazuh	Rule 60154 / Level 12	Administrators Group Changed	High-value alert observed for local Administrators modification

6. Potential Impact

- A newly created local administrator account may provide persistent privileged access to an endpoint.
- If unauthorized, this activity could allow a threat actor to execute privileged commands, weaken host security controls, or stage additional tooling.
- Administrator group changes should be reviewed quickly because they directly affect local privilege boundaries.

7. Investigation Steps

1. Executed controlled test commands to create a local user account and add it to the Administrators group.
2. Verified local account and group membership from PowerShell.
3. Reviewed Windows Security logs for Event ID 4720 and Event ID 4732.
4. Reviewed Wazuh Threat Hunting events for user account creation and administrator group modification alerts.
5. Opened Wazuh document details to confirm event source, endpoint identity, event ID, target user, target group, and rule description.
6. Removed the lab account from Administrators, deleted the account, and verified cleanup.

8. Containment and Remediation

The local administrator membership was removed first, followed by deletion of the test account:

```
net localgroup administrators labtest /delete
net user labtest /delete
net user labtest
```

The final validation command returned that the username could not be found, confirming that the account was removed.

9. Potential MITRE ATT&CK Mapping

This was a controlled simulation, so the mapping below is contextual rather than a formal attribution of malicious activity.

Technique	Relevance to Scenario
T1136.001 - Create Account: Local Account	A local account named labtest was created on the Windows endpoint.
T1098 - Account Manipulation	Local group membership was modified by adding labtest to the Administrators group.

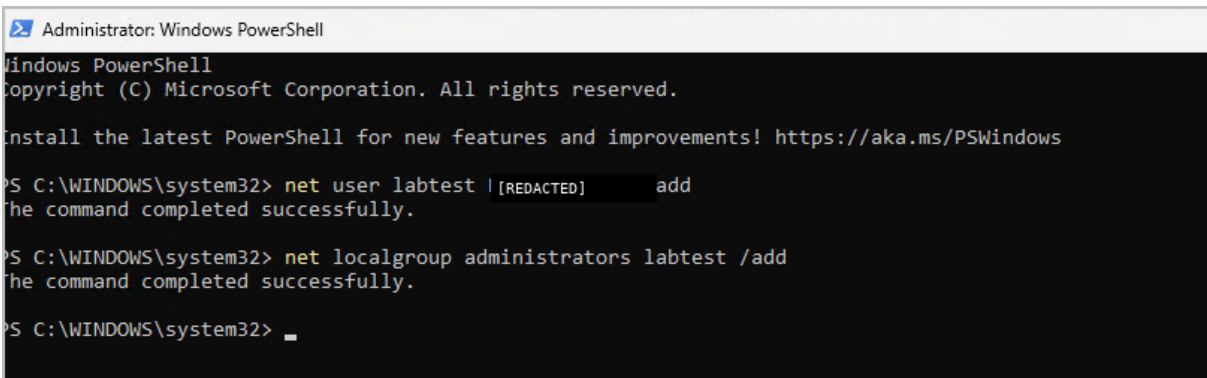

10. Lessons Learned

- Local account creation and administrator group membership changes are high-value events for endpoint monitoring.
- Windows Security logs provide strong evidence for account and group-management activity.
- Wazuh can centralize and alert on these events, making the activity easier to investigate from a single dashboard.
- Sysmon adds additional process-level telemetry that can help correlate commands such as net.exe with the resulting Windows Security events.

11. Evidence Index

Evidence ID	Screenshot / Artifact	Purpose
EVID-01	Test-User-Created-And-Added-To-Admins	Shows controlled account creation and administrator group addition.
EVID-02	Test-User-Admin-Membership-Verified	Shows labtest membership in local Administrators.
EVID-03	Windows-Security-Log-User-Created	Shows Windows Event ID 4720 for labtest.
EVID-04	Windows-Security-Log-Admin-Group-Change	Shows Windows Event ID 4732 for Administrators group modification.
EVID-05	Wazuh-Local-User-Created-Event	Shows Wazuh alert for user account creation.
EVID-06	Wazuh-Admin-Group-Modification-Event	Shows Wazuh alert for Administrators group change.
EVID-07	Test-User-Cleanup-Verified	Shows account removal and cleanup verification.

Appendix A: Command and Local Validation Evidence

```
Administrator: Windows PowerShell
Windows PowerShell
